# Correct PDFs

- must be created from composite postscript using the Adobe Distiller application (i.e. by the process: Source application > Postscript > Adobe Acrobat Distiller > PDF file)
- do not create it by saving or export directly from source application (e.g. Adobe InDesign, QuarkXPress, etc.). PDF files created in this manner has a different internal structure, which is not identical to the requirements of the output equipment (proof, CtP, platesetter). Problems occur most often here with processing fonts and with transparency, so in certain cases PDF files created in this manner cannot be processed whatsoever. In certain cases this can be resolved by re-saving into postscript and back into PDF. Our DTP studio however does not bear responsibility for small text errors which may occur due to re-saving.
- must be compatible with Acrobat 4.0 (PDF version 1.3) , optimised for printing (press optimised)
- do not use OPI comments during creation

Adobe Acrobat Distiller 6:
setting is accessible by means of the menu Settings > Edit Adobe PDF Settings [Ctrl+E]

- the setting created can be saved using the command Save As... as a preset profile, which can then be used simply in processing further files.
